

Anolis trinitatis

System: Terrestrial

Kingdom	Phylum	Class	Order	Family
Animalia	Chordata	Reptilia		Polychrotidae

Common name Trinidad anole (English), Saint Vincent's bush anole (English)

Synonym *Anolis vincenti* , Garman, 1887
Anolis trinitatis , Schwartz & Henderson, 1991
Anolis trinitatus , [sic] Creer *et al.*, 2001
Anolis trinitatus , [sic] Nicholson *et al.*, 2005

Similar species

Summary St. Vincent's bush anole, *Anolis trinitatis* has been introduced and established on Trinidad since the early 1800's along with the similar and also introduced bronze anole *A. aeneus*. *Anolis trinitatis* is less widespread and common than *A. aeneus*. While this was once thought to be due to competition and hybridisation, it is now thought to be due to the requirement of *A. trinitatis* for well-vegetated habitat and increasing levels of urban development.

[view this species on IUCN Red List](#)

Species Description

Anolis trinitatis is ecologically ubiquitous (Hite *et al.*, 2008; in Hailey *et al.*, 2009). It is variable in colour in its native range. Males can grow up to 74 mm from snout to vent (Hailey *et al.*, 2009). Introduced individuals on Trinidad are almost always bright green implying that the original population were from well-vegetated areas; the reduction in genetic variability within this population was also documented by Gorman *et al.* (1978). A requirement for well-vegetated areas and increasing urban development have been hypothesised to be responsible for the now limited distribution and abundance of *A. trinitatis* on Trinidad (Hailey, *et al.*, 2009).

Notes

Introduced populations of *Anolis trinitatis* on Trinidad were only recognised as a separate species from the introduced bronze anole (*A. aeneus*) in the 1950's (Kenny and Quesnel, 1959; in Hailey *et al.*, 2009). Other introduced anoles on Trinidad include Watt's anole (*A. wattsi*) and the Barbados anole (*A. extremus*) the presence of which has not been reported since 1982 (Hailey *et al.*, 2009).

Habitat Description

Although noted as ecologically ubiquitous in its native range, the decline of *Anolis trinitatis* on Trinidad has been hypothesised to be due to a requirement for well vegetated areas and an increase in urban development (Hailey *et al.*, 2009).
