

Xanthomonas axonopodis pv.citri 正體中文

System: Undefined

Kingdom	Phylum	Class	Order	Family
Bacteria	Proteobacteria	Gammaproteobacteria	Xanthomonadales	Xanthomonadaceae

Common name citrus canker (English)

Synonym

Similar species *Xanthomonas campestris*, *Alternaria limicola*

Summary *Xanthomonas axonopodis* pv.citri is a bacteria affecting citrus trees that thrives in areas with high temperatures, heavy rainfall, and high winds. In areas with these characteristics, *X. axonopodis* pv.citri causes citrus canker, which imparts heavy economic losses on citrus industries. It is spread through the inadvertent translocation of infected citrus fruits and seedlings to uninfected areas. Locally, *X. axonopodis* pv.citri is spread with the help of the Asian citrus leaf miner, which exposes the bacteria for spread by wind and rainfall.

[view this species on IUCN Red List](#)

Species Description

FDACS (2002) describes the appearance of leaves and fruit of infected plants as brown with raised lesions surrounded by oily, water-soaked yellow rings. Old lesions in leaves may fall out, creating a shot-hole effect. Masses of rod-shaped bacteria streaming from the edges of thinly cut lesion sections can be observed in infected citrus plants.

Please see PaDIL (Pests and Diseases Image Library) Species Content Page [Bacteria: Citrus canker \(canker A\)](#) for high quality diagnostic and overview images.

Habitat Description

Xanthomonas axonopodis pv.citri has been found in all types of citrus, including oranges, sour oranges, grapefruit, tangerines, lemons, and limes (FDACS, 2002). *X. axonopodis* pv.citri is unlikely to be found in regions where temperature increases while rainfall decreases because the disease prefers high temperatures and heavy rainfall (Gabriel, 2002).

Reproduction

According to Campbell *et al.* (1999), bacteria reproduce asexually using binary fission. Binary fission is a type of cellular division in which each dividing daughter cell receives a copy of the single parent chromosome.

General Impacts

Xanthomonas axonopodis pv.citri causes the citrus tree to continually decline in health and fruit production until ultimately it produces no fruit at all and kills the tree (FDACS, 2002). Gabriel (2002) notes that the disease causes major economic losses to the citrus industry and is a nuisance to people with ornamental citrus trees. In the United States, Florida is at high risk because of its high humidity throughout the year, seasonal hurricanes, and frequent thunderstorms that are accompanied by high wind gusts. The 8.5 billion dollar citrus industry is critical to the well being of Florida's economy (FDACS, 2002).

Management Info

Preventative measures: The best preventive measure is to catch the infection early before it spreads extensively. Gabriel (2002), however, points out that because of increasing levels of international travel, and in spite of rigorous quarantine measures, the disease is likely to be reintroduced into citrus orchards repeatedly because of people inadvertently bringing infected citrus fruits and seedlings to uninfected places.

Physical: According to Gabriel (2002), *X. axonopodis* pv. *citri* distribution and survivability is strongly influenced by the ecological conditions surrounding its host. The Asian citrus leaf miner (*Phyllocnistis citrella*), an invasive in Florida, increases the spread of *X. axonopodis* pv. *citri* by exposing the disease for easier spread by wind and rainfall. FDACS (2002) states that no chemical compound is known to destroy the bacteria within the plant tissue. So in order to eradicate the disease, the infected and exposed trees must be cut down and disposed of properly. When an infected tree is found, all trees within 1,900 feet of it must also be cut down. Researchers determined that approximately 95% of the trees that became diseased were up to 1,900 feet away from a single disease-positive tree.

The American Phytopathological Society (APS) offers on its website illustrated lessons to introduce the symptoms and signs, pathogen biology, disease cycle, epidemiology, disease management, and scientific, economic and social significance of major plant diseases. Please follow this link [Citrus canker](#) for details.

Pathway

The disease could be carried in plants or on equipment. Contaminated plants may be exchanged through the nursery trade industry.
