Similar species

Summary

Rubus moluccanus is a member of the raspberry and blackberry family and has a wide distribution throughout South-East Asia and the Pacific. Its berries, fruit and leaves are able to be used for a variety of culinary purposes and medicinal purposes. It can spread via runners that sprout when they touch the ground and its seeds are dispersed by birds. This scrambling shrub or climber reaches 2 to 3m high and threatens native plants through overcrowding and competition and its prickly stems may pose a hazard to humans and livestock.

Species Description

Rubus moluccanus is a scrambling shrub or climber reaching 2 to 3m high. The stems and leaves are armed with medium sized spines (PIER, 2002). The leaves are large and lobed, glabrous or sparsely hairy above, densely white or rusty hairy below (Stanley and Ross, 1983 in PIER, 2002). The flowers are white and borne in clusters. The berries are red and about 1cm across (PIER, 2002). There are five taxonomic varieties, two of which are outlined below.

R. Moluccanus var. *moluccanus*: leaves are shallowly lobed, has erect brown-yellow hairs on leaf stalks and branchlets, white petals.

R.moluccanus var.*trilobus*: distinct 3-lobed leaf, appressed greyish hairs on leaf stalks and branchlets, mostly pink petals (Bean, 2001).

Notes

A serious pest on the Mascarene Islands in the Indian Ocean (PIER, 2002). On U.S. Federal noxious weed list, as well as being classed as noxious in Florida and South Carolina (Plants Database, 2002).

Plants in the *Rubus* genus are known to be susceptible to honey fungus (Huxley, 1992 in Plants for a Future, 2002).

Uses

Leaves are abortifacient, astringent and emmenagogue. Fruit can be used as a remedy for bed-wetting in children (Chopra *et al.* 1983 in Plants for a Future, 2002). A purple-blue dye can also be made from the fruit (Grae, 1974 in Plants for a Future, 2002). Aboriginal people in Australia utilise the berries, which can be made into jams, jellies and pies. Tea brewed from the leaves can be used to treat diarrhea (Notman, 2000).

Habitat Description

Favours wet lowland areas (PIER, 2002). Occurs in rainforest edges in Australia (Notman, 2000). Grows to 2100m. elevation in the Himalayas (Chopra et. al. 1986 in Plants for a Future, 2002).

Reproduction

Flowers are insect-pollinated. Fruits are dispersed by birds (PIER, 2002). Roots can grow from the point at which a branch touches the ground (Mallinson, 1998).

Nutrition

Needs a good deal of sunlight for best flowering and fruiting, although can tolerate semi-shade. Has a high water requirement and does not tolerate poorly drained soil (Plants for a Future, 2002).

General Impacts

No specific information is available for this species, but as it is closely related to *R. rosifolius*, its impacts may be similar, namely:

Threatens native plants through overcrowding and competition. The prickly stems may pose a hazard to humans and livestock (Mallinson, 1998).

Management Info

No specific management information was found for *R. moluccanus*, but techniques used for the control of blackberry (*Rubus fruticosus* agg.), which is a related species, may be applicable. These are outlined below.

Mechanical control: Tractor and rotary slasher, hand cutting.

Chemical: There are a range of herbicides that can be used for the control of blackberry, including those that are glyphosate-based, such as Roundup®. These are usually applied by spraying, using a knapsack or mistblower for smaller infestations, or handgun and hose for larger ones (Mallinson, 1998).

Biological: Maintenance of soil fertility and pasture may reduce infestations. Goats (*Capra hircus*) are able to control infestations through grazing. Care must be taken with this approach however, as goats are a known invasive species as well.
