

Vinca major [简体中文](#) [正體中文](#)

System: Terrestrial

Kingdom	Phylum	Class	Order	Family
Plantae	Magnoliophyta	Magnoliopsida	Gentianales	Apocynaceae

Common name greater periwinkle (English), large periwinkle (English, United States), blue periwinkle (English, Australia), periwinkle (English, United States), bigleaf periwinkle (English, United States)

Synonym *Vinca major* ,L. var. *variegata* Loud.

Similar species *Vinca minor*

Summary *Vinca major* is introduced to new locations usually as an ornamental or medicinal herb. It spreads locally from dumped garden waste, plant fragments carried downstream and as a garden escape along shady corridors. It grows most vigorously in moist shady areas in forests, along streams and urban areas. Once established the herb competes with native vegetation by smothering all native groundcover vegetation and preventing the regeneration of trees and shrubs. *Vinca major* is a serious threat to the understorey of forested areas and streamside vegetation.

[view this species on IUCN Red List](#)

Species Description

Vinca major is a perennial, evergreen herb with erect flowering stems (0.25-0.5m long) and trailing non-flowering stems (1m long) that roots at the node. The stems contain a milky latex and shiny, dark green leaves that are 2-3cm long, opposite, round ovate, and pinnately (having parts arranged on each side of a common axis) veined. The leaves have hairs 0.1-0.4mm long along the edges and the midribs on the upper surface. The flowers are blue to violet, 2-5cm diameter and made up of five equally sized petals (Bean and Russo, 2003).

Lifecycle Stages

Flowering occurs in the spring and summer in Australia (CCSER, UNDATED).

Uses

According to Schittler (1973, in Bean and Russo, 2003), *V. major*, "has been introduced to many continents as a medicinal herb and subsequently as an ornamental ground cover."

Habitat Description

ESC (UNDATED) states that, “moist shady situations will produce thickest growth”. It commonly occurs along riverbanks, on silty alluvial soils, but may also appear around the edges of towns, in cemeteries and anywhere where garden refuse is dumped. Bailey (1914, in Bean and Russo, 2003) describes *V. major* as being able to, “grow in the deepest shade, even in poor soil”. However, “*V. major* grows most vigorously in moist soil with only partial sun”. According to Stearn (1973, in Bean and Russo, 2003) and Muenscher (1955, in Bean and Russo, 2003) hot, dry, or cold weather can cause the herb to die back temporarily. *V. major* is most commonly found around lawns, roadsides, cemeteries, and shaded waste places in moist rich soil where it has escaped. According to Bean and Russo, it often spreads from old home sites and due to its shade requirement, often grows in patches around the bases of trees and around drainages where dense cover is available. According to CCSER (UNDATED), *V. major*, “does better in moist areas, especially on ephemeral or permanent creeklines and river channels”.

Reproduction

According to Bailey (1914, in Bean and Russo 2003), “the best means of propagating is by division or by cuttings, as the seeds rarely mature”.

General Impacts

According to Bailey (1914, in Bean and Russo, 2003) and McClintock (1985, in Bean and Russo, 2003), *Vinca major* forms dense stands that exclude other herbs and creates a problem in areas where it competes with native herbs. According to CCSER (UNDATED), “this species is a particular threat to the understory of riverine vegetation as it will spread from plant fragments carried by high flows”. According to ESC (UNDATED), *V. major*, “forms dense mats which smother all native groundcover vegetation and prevent regeneration of trees and shrubs. This can have important long term consequences on streambanks, where the eventual loss of native tree and shrub cover could lead to erosion”.

Management Info

Physical: Muenscher (1955, in Bean and Russo, 2003) recommends manual removal by raising the runners with a rake, mowing them down close to the ground, or digging them out by hand.

Chemical: According to CCSER (undated), “removal of stolons [the trailing branch that produces new plants from buds; a runner] by hand and spot spraying active growth with 0.25% triclopyr in water or 1% glyphosate in water” are effective control measures currently used. According to Bean and Russo (2003), the most effective chemical controls are paraquat and Goal, which contain the active ingredient oxyflurfen. Other chemicals that have been proven effective are 2,4-D, 2,3,6-TBA, and Fenuron.

Pathway

V. major is introduced to new locations as a medicinal herb (Bean and Russo 2003). *V. major* is commonly sold as an ornamental (Bean and Russo, 2003). *V. major* is planted as an ornamental ground cover (Bean Russo, 2003).
