***Potamogeton perfoliatus*** 简体中文 正體中文 **System:** Terrestrial

| Kingdom | Phylum | Class | Order | Family |
|---|---|---|---|---|
| Plantae | Magnoliophyta | Liliopsida | Najadales | Potamogetonaceae |

**Common name** perfoliate pondweed (English), redhead grass (English), claspingleaf pondweed (English)

**Synonym** *Potamogeton amplexicaulis* , Kar.
*Potamogeton bupleuroides* , Fern.
*Potamogeton perfoliatus* , var. *bupleuroides* (Fern.) Farw.
*Potamogeton perfoliatus* , ssp. *bupleuroides* (Fern.) Hult

**Similar species** *Potamogeton crispus, Potamogeton praelongus, Potamogeton richardsonii*

**Summary** Potamogeton perfoliatus is a submerged aquatic plant that occurs in still and flowing freshwaters in temperate climates. It is known as clasped pondweed as the leaf bases perfoliate (are wrapped around the stem). This is one of the commonest pondweeds. All the leaves are under water; there are no floating leaves as in some other common Potamogeton species. It is common in lakes, ditches and slow rivers and streams, and is tolerant of quite a wide range of nutrient status.

view this species on IUCN Red List

**Species Description**
*Potamogeton perfoliatus* is one of the common pondweeds, rather robust, with the leaf bases wrapped around the stem. All the leaves grow under water and there are no floating leaves. Leaves are flat, oval-shaped, 2-6cm long, narrow (due to lack of light and calcium) but margins are slightly crisped (Farmer, 2003; MDNR, 2005). Plants have thicker, darker green foliage than do plants growing in deeper water (MDNR, 2005). Ailstock and Shafer (2004) state “reedgrass typically survives in winter by persistence of sparsely branched pale rhizomes embedded in the sediments. Inflorescences are variable but mostly consisting of 5-12 flowers with each consisting of 4 carpels which in turn contain a single ovule. Seed formation ranges from 20-48 seeds per inflorescence\". Redhead grass has an extensive root and rhizome system that securely anchors the plant (MDNR, 2005).

**Uses**
*Potamogeton perfoliatus* is considered an excellent food source for waterfowl (MDNR, 2005). Seeds, stems, and rootstock are valuable source of food for redhead ducks, canvasbacks, mallards, black ducks, Canada geese and tundra swans. Provides habitat for many aquatic organisms.

**Habitat Description**
*Potamogeton perfoliatus* grows best on firm, muddy soils and in quiet water with slow-moving currrent (MDNR, 2003). The pond weed is indicative of a wide range of nutrient conditions and pH tolerance. However some are only found in moderately acid to moderately alkaline conditions. Habitat types: Fresh to brackish water; high pH; muddy, fine sediment; slow moving water; shallow water; and provides habitat for marine mammals.

**Reproduction**
Reproduction is through a combination of vegetative or clonal offspring and those resulting from seeds (Ailstock and Shafer, 2004). Seeds are the most significant contributor to the reproductive potential of perennial species (Ailstock and Shafer, 2004). MDNR (2005) reports that \"asexual reproduction occurs by formation of over-wintering, resting buds at the ends of rhizomes. Sexual reproduction regularly occurs in early to mid-summer. Spikes of tiny flowers emerge from leaf axils on ends of plant stems. Flower spikes extend above the water surface and the pollen is carried by wind. As fruits mature they sink below the surface where they release seeds\".

**Management Info**
Champion and Clayton (2001) Aquatic Plant Weed Risk Assessment Model classifies *P. perfoliatus* as a high risk species in New Zealand.

**Pathway**
*Potamogeton perfoliatus* is reported present in New Zealand as being sold as an ornamental plant (Champion and Clayton, 2000).Stem fragments of the plant can be dispersed to other waterways by boats, trailers, nets and machinery (RNZIH, 2005).*Potamogeton perfoliatus* is reported present in New Zealand as being sold as an ornamental plant (Champion and Clayton, 2000).

**Summary:** This report is the second stage in the development of a Border Control Programme for aquatic plants that have the potential to become ecological weeds in New Zealand. Importers and traders in aquatic plants were surveyed to identify the plant species known or likely to be present in New Zealand. The Aquatic Plant Weed Risk Assessment Model was used to help assess the level of risk posed by these species. The report presents evidence of the various entry pathways and considers the impact that new invasive aquatic weed species may have on vulnerable native aquatic species and communities.

Freshwater Biodata Information System New Zealand (FBIS), 2005
**Summary:** The Freshwater Biodata Information System (FBIS) contains fish, algae, aquatic plant and invertebrate data and metadata gathered from New Zealand s freshwater streams, rivers and lakes. FBIS provides different ways to search for biodata: choose a predefined search from a list of common searches; use the map view to draw a box on a map and search for biodata; or create your own search for maximum search flexibility. FBIS is offered as a nationally available resource for the New Zealand public, institutions and companies who need access to a well-maintained long-term data repository.
