

MC (Minimal Concern) *Eleutherodactylus johnstonei*

Date assessed	2020-09-01
Year published	2021
Eicat category	MC (Minimal Concern)
Justification for EICAT assessment	Leptospire were found in blood and tissue samples collected from <i>E. johnstonei</i> from Barbados. Although evidence for transmission scant and it is not known if frogs function as disease reservoirs, this species does harbour the parasites responsible for Leptospirosis (Everard et al. 1990).
Confidence rating	Low
Mechanism(s) of maximum impact	Transmission of disease
Countries of most severe impact	
Description of impact	Leptospire were found in blood and tissue samples collected from <i>E. johnstonei</i> from Barbados. Although evidence for transmission scant and it is not known if frogs function as disease reservoirs, this species does harbour the parasites responsible for Leptospirosis.
