

MN (Minor) *Dicrurus macrocercus*

Date assessed	2020-05-19
Year published	2021
Eicat category	MN (Minor)
Justification for EICAT assessment	The Black Drongo predares on native bird and insect species on Rota and Guam. This predation is believed to have caused a decline in the population of the Rota White-eye (<i>Zosterops rotensis</i>), but studies failed to link predation by Black Drongos with declining populations of native bird species on Rota. No population level impacts have been observed (Maben 1982, Amidon 2000, Fancy and Snetsinger 2001).
Confidence rating	Low
Mechanism(s) of maximum impact	Predation
Countries of most severe impact	U.S.A. (sovereign state) Mariana Islands
Description of impact	
Assessor	Thomas Evans
Contributors	
Reviewers	EICAT authority
Recommended citation	Thomas Evans. (2025). <i>Dicrurus macrocercus</i> . IUCN Environmental Impact Classification for Alien Taxa (EICAT) .
