MC (Minimal Concern)Psittacara erythrogenys

Date assessed	2021-11-29
Year published	2023
Eicat category	MC (Minimal Concern)
Justification for EICAT assessment	Red-masked Parakeets were observed nesting in tree cavities. Competitive interference in southeast Florida is minimized by the urban affinities of parrots in this region. The relative abundance and geographic distribution suggest that these parrots are unlikely to invade adjacent wilderness areas. To date the competition impact of Red-masked Parakeets is negligible (Diamond and Ross 2019).
Confidence rating	High
Mechanism(s) of maximum impact	Competition
Countries of most severe impact	U.S.A.
Description of impact	To date the red-masked parakeet has a negligible competition impact on native cavity-nesting bird species in Florida.
